What is UMass Marketplace?

UMass Marketplace is a web platform where users can **buy and sell items** within the campus community.

Sellers can **create** listings by uploading images and entering **product details** such as name, description, price, and category.

Buyers can **search and filter** listings by keywords, category, and price range to find relevant items. Each listing includes access to the **seller's profile** and active listings.

The platform enables **messaging** between **buyers and sellers** to discuss details and coordinate pickup in a public location on campus.

Posting

Use Case 1 - Posting

Goal	Student seller posts a product for sale.
Primary actor	UMass Seller (logged-in user with UMass email).
Precondition	Seller logged in their account. Seller filled in all the required information of the product.
Success end condition	Product has been posted and is visible in the marketplace.
Failure end condition	Product has not been posted.
Secondary actors	System
Trigger	Seller selects the option to post a product.

Use Case 1 - Posting

Main success scenario	1. Seller enters account credentials and logs in. 2. System presents the marketplace dashboard. 3. Seller selects "Post Product." 4. System presents product posting form. 5. Seller enters product details (name, description, price, category). 6. Seller uploads product images. 7. Seller submits the product listing. 8. System validates the information. 9. System posts the product and confirms successful listing.
Variations (error scenarios)	1a. Login credentials are incorrect. System returns seller to login screen. 5a. Required product information is missing. System prompts seller to complete the form. 6a. Image upload fails. System displays an error and requests re-upload. 8a. System validation fails (product is flagged suspicious). Product is not posted.
Variations (alternative scenarios)	5. Seller selects "Save as draft" instead of submitting.

Texting Sellers

Use Case 2 - Texting Sellers

Goal	Enable a UMass student buyer to message a seller about a listing and coordinate next steps (questions, pickup, price, availability).
Primary actor	UMass student Buyer (logged-in user).
Precondition	• Buyer is authenticated as a UMass student (verified @umass.edu). • Seller has an active listing posted.
Success end condition	• Message is successfully delivered and stored in a conversation thread. • Seller receives a notification and can respond.
Failure end condition	• Message is not sent (not verified, blocked, listing removed, network error). • No conversation thread is created/updated.
Secondary actors	Web app/Backend server, Database, Email-verification services, Web notification system
Trigger	Buyer selects message seller

Use Case 2 - Texting Sellers

Main success scenario

1. Buyer opens a listing.
2. Buyer taps Message Seller.
3. System opens chat thread tied to that listing.
4. Buyer types message
5. Buyer optionally selects/attaches a suggested meetup location and time.
6. Buyer presses Send.
7. System validates: user verified, listing active, text not empty, rate limits ok.
8. System stores message + metadata (listing ID, timestamps, sender/receiver IDs, optional location).
9. Seller is notified.
10. Seller opens chat and replies.
11. System displays updated conversation for both users.

Variations (error scenarios)

- E1: Buyer not verified → system blocks messaging, prompts "Verify @umass.edu to message."
E2: Listing deleted/sold → system prevents send, shows "This listing is no longer available."
E3: Seller blocked buyer / buyer blocked seller → system blocks chat, shows "Messaging unavailable."
E4: Empty or invalid message → system shows validation error.
E5: Network/server failure → message shows "Failed to send" with retry.

Variations (alternative scenarios)

Negotiate price: Buyer sends offer; seller accepts/counters inside chat.

Filter & Search

Use Case 3 - Filter & Search

Goal	Buyer finds relevant listings by searching certain keywords and/or applying filters (e.g. price range, category)
Primary actor	UMass Buyer (logged-in user)
Precondition	Buyer is logged in on the UMass Marketplace site; listings are already on site
Success end condition	The buyer sees a refined list of listings that match their search query and selected filters
Failure end condition	No results are returned/fail to load due to no matching listings, invalid filter input
Secondary actors	Marketplace system (search/filter engine), listing database
Trigger	Buyer enters a keyword in the search bar and/or selects a filter (category, min/max price) and submits/updates the search

Use Case 3 - Filter & Search

Main success scenario	1. Buyer navigates to the listings/browse page 2. Buyer enters a search item 3. Buyer optionally selects filters 4. Buyer clicks “Search” or results update automatically 5. System validates inputs and queries the listings database 6. System displays matching listings sorted by default order 7. Buyer scrolls through results and selects a listing to view details
Variations (error scenarios)	E1: No matching results → System displays “No listings found” and suggests removing filters or trying different keywords E2: Invalid price input (e.g. min > max or non-numeric) → System highlights error and prevents applying filter until corrected E3: Search service/network error → System shows “Something went wrong” and a retry option E4: Too broad query (e.g. blank search with no filters) → System shows default browse results and prompts user to filter/search (optional)
Variations (alternative scenarios)	Filter only browsing → Buyer selects category/price without typing keywords; results update Search only → Buyer searches keywords without filters; system returns results by relevance/newest Clear filters → Buyer clicks “Clear” to reset filters and return to default listing view Combined category + keyword → e.g. Buyer searches “desk” and filters Category = Furniture to narrow results faster

Seller Details

Use Case 4 - Seller Details

Goal	Buyer can view the seller's information and listings to contact the seller
Primary actor	UMass Student Buyer (logged-in user)
Precondition	Buyer is logged in; Seller has at least one listing (active or sold); Seller has an existing profile
Success end condition	Seller details page is displayed showing seller profile information and listings, allowing the buyer to follow the seller or initiate messaging
Failure end condition	Seller details page cannot be displayed either due to the account removal (missing data), privacy restriction or server error
Secondary actors	Marketplace system, seller database, listing database, messaging system
Trigger	Buyer selects the "Seller Details" button or clicks the seller name from the listing page

Use Case 4 - Seller Details

Main success scenario

1. Buyer opens the listing page
2. Buyer selects the Seller Details open
3. System validates buyer session
4. System retrieves seller profile information (name, profile photo, join date)
5. System retrieves seller's item listings
6. Buyer optionally chooses to Follow the seller or Message the seller

Variations (error scenarios)

- E1:** Seller account deleted or unavailable -> System displays "Seller not available" and prevents further actions
- E2:** Seller has no active listings -> System displays profile with empty listings section
- E3:** Buyer not logged in -> System prompts buyer to login before viewing seller details
- E4:** Network/ Server Error -> System displays error message and retry options

Variations (alternative scenarios)

- A1:** Buyer views seller's sold listings (marked as sold)
- A2:** Buyer follows the seller for future updates
- A3:** Buyer selects a listing from seller's listings to view details
- A4:** Buyer navigates back to the marketplace or the previous listing

Thanks!
