Manager: Vidhita Mittal

I analyze the functional points for the software product in the first release with the most important functionalities (core).

A. External Inputs (EIs)

1. Register / login
2. Create postings: add product
3. Edit / delete postings
4. Send message
5. Confirm transactions

B. External Outputs (EOs)

1. Notifications (messages)
2. System successful/fail messages:
login or register, listing created
3. Order confirmed

C. External Inquiries (EIs): simple request-response

1. View product listings of an user
2. View product listings of a
search/filter

3. View a specific product details

4. View chat history

5. View past purchases/transactions

D. Internal Logical Files (ILFs):

system owned data

1. Users

2. Products

3. Postings

4. Messages

5. Orders

E. External Interface Files (EIFs):

external systems

1. Payment gateway (maybe)

Type	Count	Simple	Average	Complex	Total
External Input	5	3			15
External Output	3		5		15
External Inquiry	5	3			15
Internal Logical File	5		10		50
External Interface File	1		7		7

We assume average complexity for most of the functions, except external input and external inquiry because they are a bit simpler.

Total: $15 + 15 + 15 + 50 + 7 = 102$
